The invention relates to increasing the content of one or more transgene-
coded biomolecules in an organism and involves changing the distribution
of ATP and/or ADP in cells of the organism. The yield of transgenic
molecules in host cells is often insufficient for industrial production.
The method increases the yield of transgenic molecules in animal and
plant host cells, therefore facilitating their production on an
industrial scale. The proteins produced by the method are useful for
diagnosing, preventing and/or treating viral diseases and cancer. The
present sequence represents a single-chain (scFv) antibody, used to
exemplify the increase in the expression of scFv antibodies in transgenic
potato tubers
                                                                                                                                                                                                                                                                                                                                                                                                              180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  231
                                                                                                                                                                                This invention describes a novel preparation of a water-soluble, naturally occurring eukaryotic polypeptide containing two or more cysteine units bound via a disulfide bridge which comprises cultivation of prokaryotic cells in the presence of arginine or an amide compound. The method is useful for the preparation of eukaryotic proteins e.g. proteases, interferons, protein hormones, antibodies or antibody fragments (e.g. a single chain FV fragment that binds to thyroid stimulating hormone). It is especially useful for preparing proteins with more than five disulfide bridges, e.g. recombinant plasminogen activator (rPA). The technique is simple and does not require in vitro after-treatment, such as the removal of inclusion bodies, reduction or naturization

```

The present invention relates to a method for production of a naturally folded eukaryotic protein containing two or more cysteines linked by disulfide bridges. The method comprises co-expression and secretion into the periplasm of a molecular chaperone via an expression vector coding for the chaperone. The expression vector also encodes a signal sequence. The method is useful for producing a naturally folded eukaryotic protein such as an antibody, antibody fragment, interferon, protein hormone or a protease containing two or several cysteines linked by disulfide bridges. The present sequence is a fusion protein composed of the PelB signal sequence and ScFvOxazolon. This sequence was used in the method of the present invention Producing naturally folded eukaryotic proteins e.g. antibodies, interferon, hormones or proteases that contain two or several cysteines linked by disulfide bridges comprises co-expression of a molecular 19; 35pp; English. GENERAL INFORMATION:

APPLICANT: Marks, James D

APPLICANT: Amersdorfer, Peter

ITTLE OF INVENTION: Therapeutic Monoclonal Antibo

TITLE OF INVENTION: Botulinum Neurotoxins

ITTLE OF INVENTION: Botulinum Neurotoxins

CURRENT APPLICATION NUMBER: US/09/144,886

CURRENT FILING DATE: 1998-08-31

NUMBER OF SEQ ID NOS: 98

SOFTWARE: PatentIn Ver. 2.0

SEQ ID NO 83

LENGTH: 107

TYPE: PRT

ORGANISM: Artificial Sequence

FEATURE:

COTHER INFORMATION: Description of Artificial Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ig heavy chain precursor V region - mouse

C; Species: Mus musculus (house mouse)

C; Date: 26-Oct-1989 #sequence_revision 31-Dec-1993 #text_change 23-Jul-1999

C; Accession: A32456

R; Dombrink-Kurtzman, M.A.; Johnson, L.S.; Riordan, G.S.; Bedzyk, W.D.; Voss
J. Biol. Chem. 264, 4513-4522, 1989

A; Title: Variable region primary structures of a high affinity anti-fluoresc
A; Reference number: A32456

A; Reference number: A32456

A; Status: preliminary

A; Molecule type: mRNA
A; Residues: 1-139 < DOM>
A; Cross-references: GB: J04609; NID: g556316; PIDN: AAA50298.1; PID: g556317

A; Note: the authors translated the codon CAC for residue 20 as Gln, and CAC
C; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin
F; 34-116/Domain: immunoglobulin homology < INM>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Voss

The VH sequence is one of eight (AAR21264-71) found to be expressed from a single chain Fv library from an immunised mouse. The library produces a diverse repertoire of antibody fragments specific for 2-phenyl-5-coxazolone (phOx). It was prepd. using cDNA generated from mRNA from mice immunised with phOx coupled to chicked serum albumin. The VH and VL kappa sequences were separately amplified by PCR (see AAQ23474-84) and ligated into fdCAT2 (see AAQ23463) for expression on the phage surface as fusions with gene III. The resulting library of clones was diverse. Twenty three hapten binding clones were sequenced revealing the eight different VH genes (A-H) in a variety of pairings with seven diffrent VK genes (a-g) (see AAR21264-92). Nearly all the VH genes belonged to gp 1, with only one, "E", being of gp 2 (VHOx1). Of the twenty three clones sequenced, only one was of type "E". Most of the clones were VK-d combinations. The Kd of VH-B/VK-d for phOx-GABA was 10 nM. Only two other combinations (of eleven tested) were found to have higher values. This suggests that phage bearing scFv fragments having weak affinities can be selected with antigen, probably due to the avidity of the multiple antibody heads on the phage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a heavy chain variable region from a mouse anti-
Vascular Adhesion Protein-1 (VAP-1) antibody. This sequence is included
in the specification for comparison with the antibody of the invention.
The murine antibody sequences of the invention may be used in the
production of a chimeric mouse-human anti-VAP-1 antibody. The nucleic
acid molecules, polypeptides or antibodies are useful in treating VAP-1
mediated inflammatory disorders, such as rheumatoid arthritis,
inflammatory bowel disease, autoimmune diseases or psoriasis. The
chimeric VAP-1 antibody is further used for in vitro and in vivo
diagnostic applications, including in vivo immunoscintigraphic imaging of
inflammation sites. The chimeric MAD's of the invention have improved
kinetic properties compared to the corresponding murine antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20

The present invention describes a method (M1) for ablating or killing an aberrant prostate specific membrane antigen (PSMA)-expressing cell (e.g. an epidermal and a dermal cell). M1 comprises contacting the cell, or a vascular endothelial cell proximate to the cell, with an antibody (or its antigen-binding fragment), which binds specifically to the extracellular domain of PSMA in an amount sufficient to ablate or kill the cell. The antibodies have antipsoriatic, antiarthritic, dermatological, cytostatic, antinflammatory and antiallergic activities, and can be used in vaccines. M1 is useful for treating a skin disorder in a subject, by administering to the subject, an amount of an antibody which binds

mammal, preferably human and is having, or at risk of, a skin disorder).

The skin disorder is a dermal or an epidermal disorder, and is selected from psoriasis (preferably chronic stationary psoriasis, psoriasis psoriasis, eruptive (gluttate) psoriasis, psoriatic erythroderma, generalised pustular psoriasis, psoriatic erythroderma, cerfoliative dermatitis, pityriasis rubra pilaris, pityriasis rosacea, psoriasis, pityriasis lichenoiders, lichen planus, lichen nitidus, ichthyosiform dermatosis, keratodermas, dermatosis, and prokeratosis, preferably psoriasis. MI is useful for treating a skin disorder such as an inflammatory or neoplastic disorder of the epidermis or dermis, preferably an epidermal precancerous or cancerous lesion. MI is also useful to treat or prevent disorders involving aberrant activity of PSMA-expressing cell, e.g. kidney, liver or brain cell. constructed by linking DNA encoding the Scrv (itself generated by linking DNA encoding the morphisms protein seminal plasma protein. The single-chain antibody (Scrv)/human carboxypeptidase A (hCPA) fusion protein (ABP97414), a prodrug of methotrexate-alpha-peptide and a pharmaceutically-acceptable auxiliary for medication. The invention also encompasses the anti-human seminal plasma protein Scrv/hCPA fusion protein, and the nucleic acid encoding it (ABZ75116). This was constructed by linking DNA encoding the Scrv (itself generated by linking DNA encoding the Scrv (itself generated by linking DNA encoding the Scrv (itself generated by linking DNA encoding the sortein monoclonal antibody E4B7) to DNAs encoding human carboxypeptidase A via a linker. The Scrv portion of the fusion protein enables it to be specifically targeted to prostate cancer the hCPA portion can then activate the prodrug which in turn has cytostatic activity towards the cancer cells. The invention permits the fusion protein to be easily produced in large quantities for use in ADEPT for prostate cancer treatment. The present sequence
                                                                                                                                                                                                                                                       (light

The invention relates to a multifunctional polypeptide comprising a domain with a binding site that specifically recognises an extracellular group of the NKG2D receptor complex and a second domain which functions as a receptor or ligand. The polypeptide and its associated polynucleotide are used for the preparation of a pharmaceutical composition for the treatment of cancer, infections and/or autoimmune conditions. The cancer may be a tumour of the head and neck, stomach, esophagus, colon, liver, intrahepatic bile ducts, pancreas, lung, larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, larynx, breast, ovary, uterus, cervix, prostate, kidney, testis, thyroid, clarynx, breast, ovary, uterus, cavix, prostate, kidney, testis, thyroid, larynx, breast, ovary, uterus, cavix, prostate, kidney, testis, thyroid, clarynx, breast, ovary, uterus, cavix, prostate, kidney, testis, thyroid, larynx, breases can be caused by viruses, bacteria, fungi, protozoa or helminths. The autoimmune diseases include multiple sclerosis, Grave's disease, ankylosing spondylitis, acute anterior uveitis, Goodpasture's syndrome, myasthenia gravis, insulin-dependent diabetes mellitus, rheumatoid arthritis, pemphigus vulgaris and autoimmune hepatitis. Sequences AAU72820-AAU72875 represent the NKG2D receptor and the polypeptides of the invention

The present sequence represents the heavy chain variable region of murine monoclonal antibody 2C4. This antibody binds to human sialoadhesin factor -2 (SAF-2). The antibody is useful for treating or preventing allergic rhinitis, allergies, asthma, anemia, eczema or diseases such as lymphoma, leukemia or systemic mastocytosis in a mammal. It is also useful for detecting the presence of a cell, especially eosinophil in a sample, by detecting binding of the antibody to SAF-2. The antibody can be coupled to toxins, antiproliferative drugs or radionuclides to kill cells in a reas of excessive SAF-2 expression

The cDNA encoding these peptides was synthesised using forward primers annealing to the Ck gene and the JH segment, followed by assembly with linker primer nested in respect to the primer used for cDNA. The assembled product within the cells is then amplified with nested primers annealing to the 5' end of the VH gene and the 3' end of the Jk segment. In-cell PCR may be used to determine gene linkage analysis, particularly for the cloning of gene combinations that are polymorphic within a population of cells, such as the rearranged genes for IGR V

The sequences given in AAR32840-43 show the mature heavy chain VH domains and the Vk light chain genes of the antiphenyloxazolone hybridomas NQ2/12.4 and NQ10/12.5 which have been linked via a linker peptide by incell PCR. The cDNA encoding these peptides was synthesised using forward primers annealing to the Ck gene and the JH segment, followed by assembly with linker primers, VH back primers based on the VH3 leader sequence and a forward Ck primer nested in respect to the primer used for cDNA. The assembled product within the cells is then amplified with nested primers annealing to the 5' end of the VH gene and the 3' end of the Jk segment. In-cell PCR may be used to determine gene linkage analysis, particularly for the cloning of gene combinations that are polymorphic within a population of cells, such as the rearranged genes for Ig or TCR V regions. (Updated on 25-MAR-2003 to correct PN field.)

The invention relates to an antibody-toxic group conjugate comprising an antibody that specifically recognises a molecule expressed only on activated T cells, and a toxic group. The T cell molecule is preferably human cytotoxic T lymphocyte associated antigen 4 (CTLA4). The antibody of the invention is a humanised anti-CTLA4 antibody comprising a sequence of 128 or 142 amino acids fully defined in the specification. The antibody-toxic group conjugate is useful for modulating the immune cesponse in a subject suffering from a disorder or condition such as autoimmune disorder, immune response to a graft, allergic response or an immune response to a therapeutic protein. The antibody is also useful for T-cell typing, for isolating specific IL-creeptor-bearing cells or fragments of the receptor, for vaccine preparation, and for determining the effectiveness of an agent to down-region of mouse antibody 26. It was used in the construction of the region of mouse antibody of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antibody

MAb 1A7 has defined light and heavy chain variable region sequences. The MAb 1A7 and polypeptides can be used for eliciting an anti-GD2 immune response. The polypeptides can also be used for detecting or purifying anti-GD2 antibody. The products can be used for treating GD2 - associated diseases, e.g. melanoma, neuroblastoma, glioma, soft tissue carcinoma, and small cell carcinoma. They can be used for palliating the disease or for reducing the risk of recurrence. The present sequence represents the heavy chain variable region consensus sequence

The invention relates to the recurrence and/or development of a ganglioside GD2-associated tumour, e.g. melanoma, in an individual which is delayed by administration of an antibody comprising light and heavy chain variable region sequences of the anti-idiotype monoclonal antibody 1A7. The antibody is used for delaying recurrence and/or development of GD2-associated tumour, e.g. melanoma, neuroblastoma, glioma, sarcoma, or small cell lung cancer, in individual, and for treating individual with GD2-associated tumour. The present sequence is a unique peptide region from an antibody sequence resembling the anti-idiotype antibody 1A7 heavy chain.

The invention relates to a monoclonal antibody 1h7 (an anti-idiotype antibody eliciting an anti-GD2(ganglioside) response). Also included are antibody eliciting an anti-GD2(ganglioside) response). Also included are antibody producing cell deposited under ATCC Accession Nov. HB-11786 (or its progeny), a polynucleotide comprising a sequence encoding a polypeptide with immunological activity of 1A7 (where the polypeptide comprises at least 5 consecutive amino acids from a variable region of 1A7), an isolated polynucleotide comprising a region of at least 20 consecutive nucleotides that is capable of forming a stable duplex with a polynucleotide encoding the light or heavy chain variable region of 1A7 under conditions where the region does not form a stable hybrid with a polynucleotide consisting of a variable region encoding sequence appearing as ADC3531 - ADC35370, a host cell comprising the polynucleotide on a fusion polypeptide comprising 1A7 variable regions and a polynucleotide, a fusion polypeptide comprising 1A7 variable regions and a vaccine comprising the antibodies. The antibodies are useful for eliciting an immune response in an individual, and for treating a GD2-associated diseases is a sesciated disease is an individual thas a clinically detectable tumour, and the method is for palliating the GD2-associated disease. 1A7 is an individual and has been treated and is clinically detectable tumour that was previously detectable time of the administering of 1A7, or for reducing the risk of recurrence of a clinically detectable tumour. And the humanised antibody are tumour cell. The present sequence represents a consensus sequence for the tumour cell. The present sequence represents a consensus sequence for the
                                                                                                                                                                                                                                                                                                                                                                that is capable of glycosphingolipid GD2, e.g., melanoma, glioma,
                                                                                                                                                                                                                                                                                                                                                                 1A7,

The present sequence is the heavy chain variable region of the group 11f8 putative consensus anti-DNA monoclonal antibody (MAb), which has a high affinity for single stranded DNA, low or no affinity for double stranded DNA and specifically binds a DNA hairpin. The MAb can be used diagnose disorders associated with the pathological complexation of DNA, e.g. inflammatory glomerulonephritis and systemic lupus erythematosus. It can also be used to generate reagents to screen for pharmaceutical agents, and treat and/or prevent an above disorder. The sequence was derived by aligning homologous anti-DNA MAb, whose sequences have been published, as well as several MAb of other specificities obtained from a database search
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120
